Do you have any suggestions for improvements?

## Do you have any suggestions for improvements?

Dividing the work for the insulin project was a bit tricky as we were divided into groups of 4 but the task only included 3 parts: Describe formation of insulin from synthesis to functional protein, the protein structure of insulin, and an overview of its functions at molecular level. Having 4 people do the work that seems to be made for 3 people caused unnecessary problems in my opinion. My solution would be to either have groups of 3 or add another clear part to write about for the project work.
maybe the biochemistry/chemistry lectures could be a little more explaining - more focus on actually explaining and working through example problems slowly
Better seminar for pH calculations. Teachers weren't good at explaining the principle. Break it down into steps and then put it all together.
spread out anatomy lectures, record lectures
I did not know that we had study director and course administrator. Who are they?

Please make sure the introduction to project work happens at the same time because it was really annoying and stressful that some groups that started on monday already had a lot of work done, while my group had introduction a couple of days later so we could not start and divide the work earlier. The introduction classes don't need to be divided that much in my opinion and it just looks more fair to start at the same time or at max in the period of 2 days.

It would have been nice to do some practical work for anatomy too like dissections. I get that some people might not prefer this, in which case maybe not making them mandatory is a good idea but still.
There were too many different, non-related concepts squeezed into one short course. It would be better to have the library lecture right at the beginning of the course. It would be helpful to have a clear instruction on how to use the website for enzyme kinetics calculations (maybe someone could show it during the seminar).
Group work also for the biochemistry part and more practice problems done in the lectures
Some teachers talk too fast or in a low voice making it hard for people at the back to hear.

## What has been the most postive within this course?

```
What has been the most postive within this course?
Anatomy Seminars
I enjoyed the variety of lecturers
the anatomy course we did physically was very good
the ease of communication with lecturers
The anatomy part and the group work for that as those topics were new and one felt proud after understanding everything.
the group work was most helpful
amazing lecturers and lab teachers.
The blend of different things
Anatomy lectures on canvas (you could go back to every detail and get more info that from regular lectures), fun labs (had a
really nice time getting to know how this works)
Labs and seminars
The TAs during group work were GREAT!!
Group work in systemic anatomy with medicine student was super helpful, practicing concepts
The insulin project, laboration.
The insulin project and lab work
The Systemic Anatomy sessions
Laboratory
Lecturers answered the students questions well and instructions for assignments were always crystal clear. Also teachers would
ask stop once in a while to check whether everyone's on board with the lecture
```
